

# TensorFlow Performance Optimizations on Intel Architectures

ACLF Developer Session  
25 July, 2018

**Vamsi Sripathi**, AI & HPC Performance Engineer

**Vikram Saletore, Ph.D.** Principal Engineer

Customer Solution Enablement, AI Products Group, Intel Corp

Representing the work of several Intel teams

# Agenda

- Motivation
- TensorFlow Optimizations
  - MKL-DNN
  - Graph optimizations
- Distributed TensorFlow
- Performance Results
- Using Intel TensorFlow
  - Installation
  - Run-time Settings
  - Profiling
  - Potential Issues
- Benchmarks & Case Studies

# Motivation

- TensorFlow
  - Popular open-source machine learning/deep learning framework
  - Front end wrapper in Python, core backend in C++
  - Multi node support
  - Widely used in industry for text, speech, image classification
  - Gaining popularity among scientific community (high energy physics, climate)
- Intel Architectures
  - Xeon: Skylake (AVX512)
    - Up to 56 cores/112 threads, DDR memory
  - Xeon Phi: Knight Landing (AVX512)
    - 68 cores/272 threads
    - High bandwidth MCDRAM (16 GB)
- To maximize performance, optimize TensorFlow for Intel hardware
  - Vectorization (FMA unit utilization)
  - Loop blocking (Cache locality/reuse)
  - Parallelization (load balancing)

		AVX2	AVX512
Vector Register Length		256 bits	512 bits
# of FMA's per cycle		2	2
Single Precision	# of FP elements per register	8	16
	Flops per cycle	32	64
Double Precision	# of FP elements per register	4	8
	Flops per cycle	16	32

# TensorFlow: Baseline Vs Intel

TensorFlow Baseline

Python: ML/DL Application

C++: Data Flow Graph

Eigen Library  
(Convolutions, Activation Functions, GEMM etc)

Hardware (CPU, GPU)

Intel Optimized TensorFlow

Python: ML/DL Application

C++: Intel tuned data flow graph

Intel MKL-DNN  
(Convolutions, Activation Functions, GEMM etc)

Intel CPU's (Broadwell, Skylake, Knights Landing)

Frontend

Backend

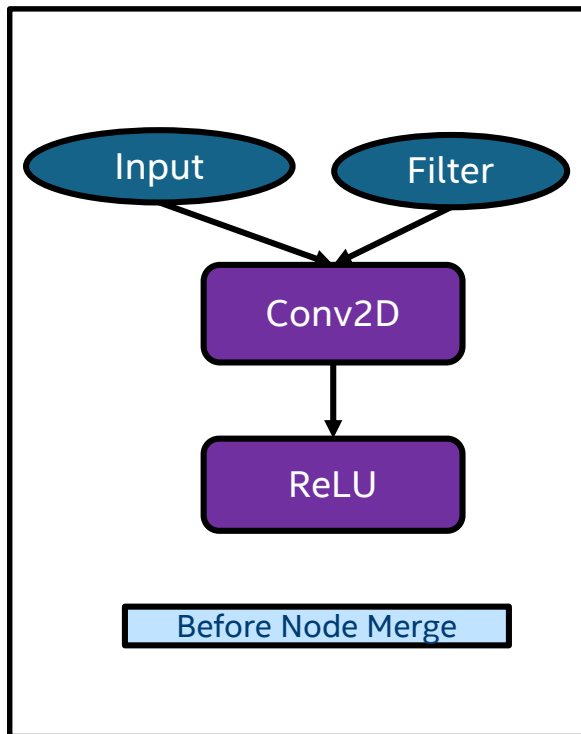

# MKL-DNN Optimizations

- Eigen implementation of DNN kernels is sub-optimal for Intel hardware
- Intel MKL-DNN is highly optimized, open-source ML/DL library for Intel CPU's
  - Specialized assembly-like kernels for DNN primitives
  - Dedicated kernels based on ISA/hardware architecture (SSE4.2, AVX2, AVX512)
  - OpenMP based multi-threading
  - <https://github.com/intel/mkl-dnn>
- Replaced Eigen API's in TensorFlow C++ backend with MKL-DNN

Primitives	Class
Convolution Deconvolution Inner Product Vanilla RNN, LSTM, GRU	Compute intensive operations
Pooling AVG/MAX Batch Normalization LRN Activations (ReLU, Tanh, ELU, Softmax, ...) Sum	Memory bandwidth limited operations
Reorder Concatenation	Data manipulation

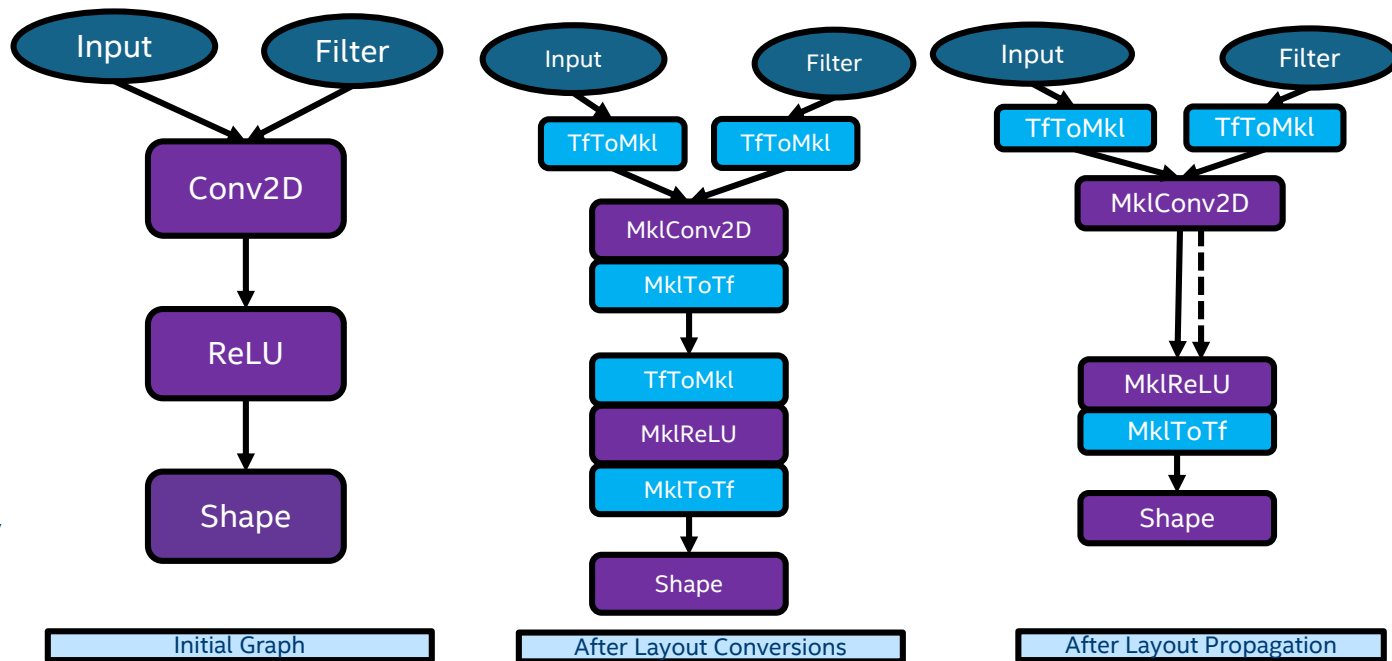

# Graph Optimizations: Operator Fusion

- Popular DNN topologies spent significant amount of time in bandwidth-bound ops
- Fuse BW-bound operators with compute ops to reduce memory pressure

# Graph Optimizations: Memory Layout

- Most popular memory layouts for image recognition are **nhwc** and **nchw**
- MKL-DNN convolutions use blocked layouts (e.g. nChw16c for AVX512)
- TensorFlow tracks memory layouts and perform reorders **only** when necessary

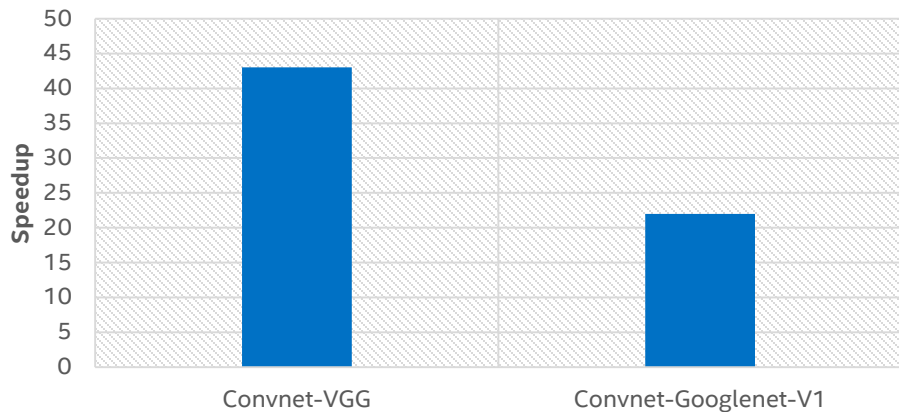

# Memory Manager

- Neural network operators (Convolutions, Matrix Multiplications) allocate large chunks of memory
- TensorFlow default memory management routines did not handle the frequent alloc/dealloc
- Implemented a memory pool allocator that reduces the overhead of memory management

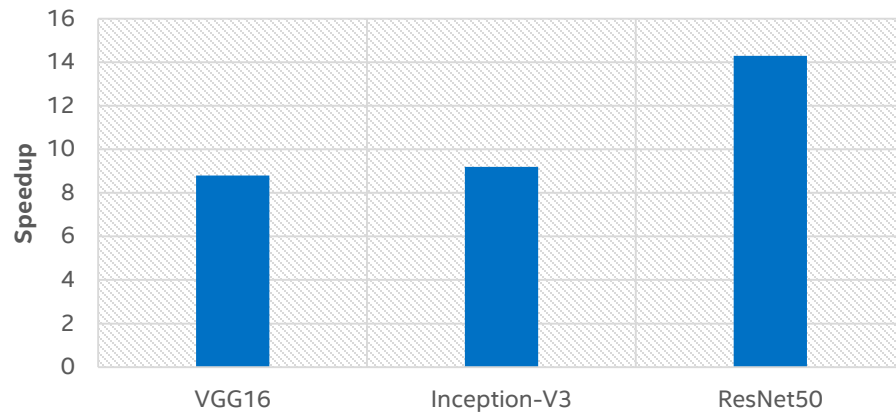

# Single-Node Performance

## Knights Landing: Intel TensorFlow Vs Baseline

## Skylake: Intel TensorFlow Vs Baseline

# Distributed TensorFlow

- Data Parallelism: Run the same model on all nodes with different data
- DL training is a strong-scaling problem
- Two mechanisms
  - Master-Worker (Google Remote Procedure Call [gRPC])
  - MPI (Uber Horovod, Intel Machine Learning Scaling Library [MLSL])
- gRPC: Inefficient scaling due to bottlenecks at parameter servers
- MPI
  - Horovod: Overlap communication and computation
  - MLSL: Horovod with better MPI\_Allreduce() – WIP, Expect

## With Parameter Server

Uber's open source MPI based Distributed training framework for TensorFlow

<https://github.com/intel/MLSL>

# Intel TensorFlow: Installation

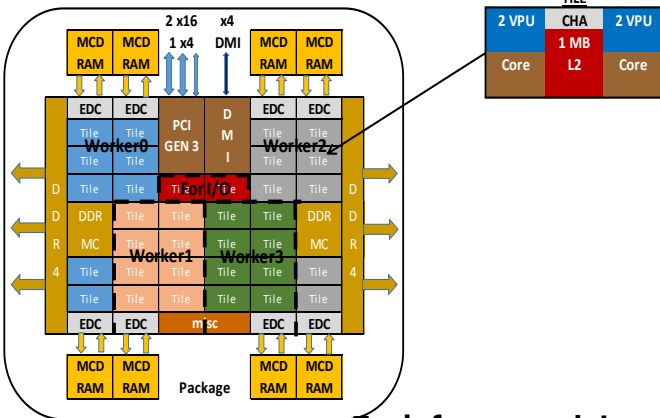

- All Intel optimizations to TensorFlow are upstreamed regularly -- <https://github.com/tensorflow>
- Get pre-compiled binaries
  - Using pip:
    - Python 2.7: `pip install https://anaconda.org/intel/tensorflow/1.6.0/download/tensorflow-1.6.0-cp27-cp27mu-linux_x86_64.whl`
    - Python 3.5: `pip install https://anaconda.org/intel/tensorflow/1.6.0/download/tensorflow-1.6.0-cp35-cp35m-linux_x86_64.whl`
    - Python 3.6: `pip install https://anaconda.org/intel/tensorflow/1.6.0/download/tensorflow-1.6.0-cp36-cp36m-linux_x86_64.whl`
- Build from source
  - `$ git clone https://github.com/tensorflow/tensorflow.git`
  - `$ cd tensorflow`
  - `$ ./configure`
  - `$ bazel build --config=opt --config=mkl //tensorflow/tools/pip_package:build_pip_package`
  - `$ bazel-bin/tensorflow/tools/pip_package/build_pip_package ~/path_to_wheel_dir`
  - `$ pip install --upgrade --user ~/path_to_wheel_dir/<wheel_name.whl>`

# Intel TensorFlow: Run-time Settings

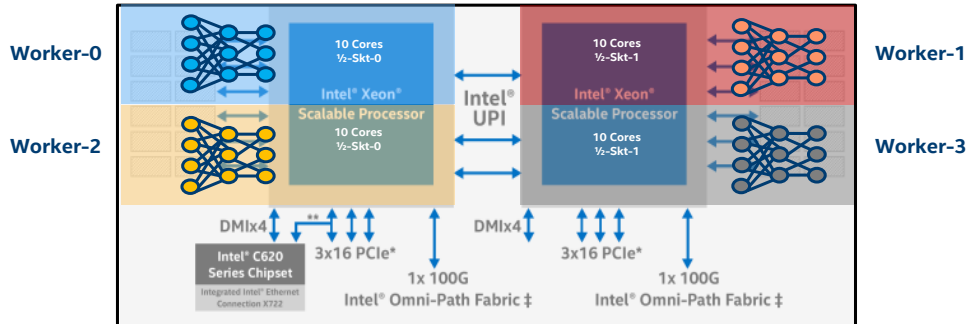

- Threading
  - `inter_op_parallelism_threads` = max number of operators that can be executed in parallel.
  - `intra_op_parallelism_threads` = max number of threads executing an operator. Usually set to # of physical cores or logical cores assigned for TensorFlow instance
  - `OMP_NUM_THREADS` = max number of threads executing MKL functions. Usually set to # of physical cores assigned for TensorFlow instance
  - `KMP_AFFINITY` = `granularity=fine,compact,1,0`
  - `KMP_BLOCKTIME` = 1 or 30
  - [https://www.tensorflow.org/performance/performance\\_guide#optimizing\\_for\\_cpu](https://www.tensorflow.org/performance/performance_guide#optimizing_for_cpu)
- Memory
  - If MCDRAM is in Flat-mode and app memory is < 16GB, use `numactl -m0 python train.py`
- Multiple TensorFlow workers on a single KNL

# Training: Multiple TensorFlow Workers per Socket

## Intel® Xeon Phi™ Processor

## 2S Intel® Xeon® Processor

Each framework instance is affinitized to cores or NUMA domains

Each CPU running 1 or more workers/node

Uses optimized MPI library for gradient updates over shared memory

Caffe – Use Optimized Intel® MPI ML Scaling Library (ML-SL)

TensorFlow – Uber horovod MPI Library

## Optimizations at run time without framework code change

# Intel TensorFlow: Potential Issues

- Threading
  - Incorrect setting of threading model parameters can lead to over- or under-subscription, leading to poor performance
- Large number of MKL Reorder ops
- Non-multiples of 16 output channels in convolutions
- Non-MKL operators
- I/O pipeline

```
OMP: Error #34: System unable to
allocate necessary resources for OMP
thread:
```

```
OMP: System error #11: Resource
temporarily unavailable
```

```
OMP: Hint: Try decreasing the value of
OMP_NUM_THREADS.
```

# SCALEOUT TRAINING PERFORMANCE WITH BENCHMARKS & USE CASES

# Multi-Node ResNet-50 Scaling Efficiency

on Intel® Xeon Phi™ 7250 Processor Cluster Stampede2\* at TACC\*

Scaling Efficiency on Stampede2 Intel® Xeon Phi™ 7250 Processor Cluster

97%  
Efficiency

- ResNet-50 with ImageNet-1K on 256 Nodes on Stampede2/TACC\*
  - 97% scaling efficiency
  - Top-1/Top-5 > 74%/92%
  - Batch size of 16 per node
  - Global BS=4096
  - Time-To-Train: 63 minutes (37 Epochs)
  - Throughput: 12526 Images/sec

Configuration Details on Slide: Stampede2\*/TACC\* Configuration Details:

Software and workloads used in performance tests may have been optimized for performance only on Intel microprocessors. Performance tests, such as SYSmark and MobileMark, are measured using specific computer systems, components, software, operations and functions. Any change to any of those factors may cause the results to vary. You should consult other information and performance tests to assist you in fully evaluating your contemplated purchases, including the performance of that product when combined with other products. # INCREASING ACCURACY FURTHER USING COLLAPSED ENSEMBLES

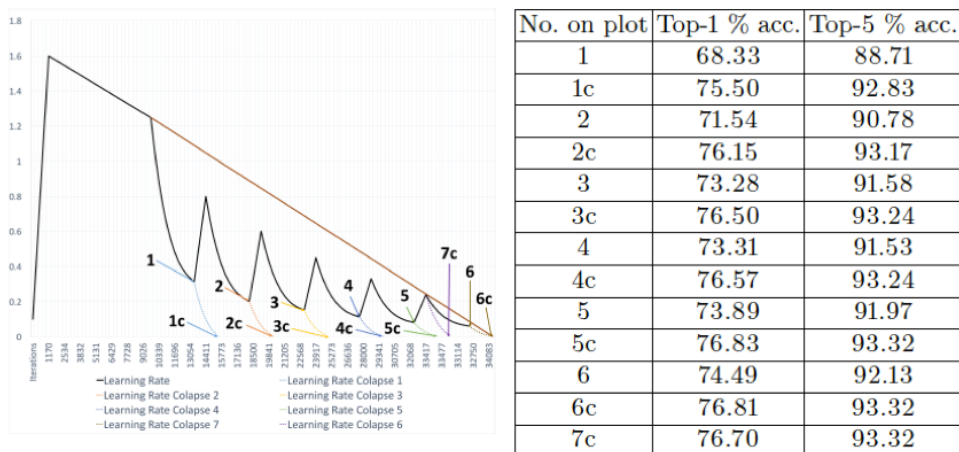

Fig. 3. Plot of learning rate behaviour when obtaining the ensemble snapshots

## Collapsed ensembles

Similar in fashion to the learning-rate collapses:

- However, after performing a partial collapse, LR is again increased
- Cycling the LR:
  - Improves single-model accuracy faster
  - Ensemble of the collapsed points leads to 77.5% accuracy using a ResNet-50 regular training budget

# PERFORMANCE WITH TENSORFLOW

# 1. ResNet-50 Benchmark Scaling With TensorFlow

Intel® Xeon® Platinum 8160 processor Cluster Stampede2 at TACC

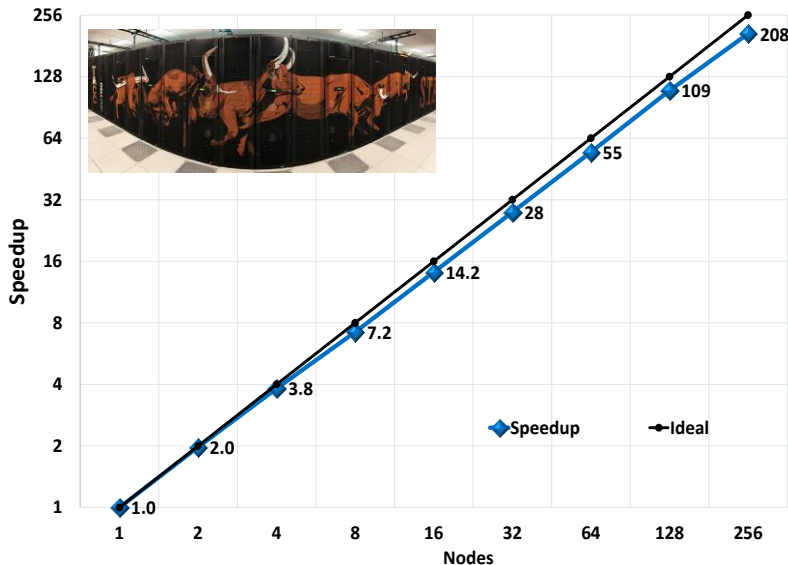

Joint work with SURFsara/Netherlands,

81% Efficiency with TensorFlow

## ResNet-50: Training Performance

Intel(R) 25 Xeon(R) on Stampede2/TACC, Intel(R) OPA Fabric

TensorFlow 1.6+horovod, IMPI, ImageNet-1K, Core Aff. Intel BKM,s BS=64/Worker

ResNet-50 with ImageNet-1K on 256 Nodes on Stampede2/TACC:

- Improved single-node perf with multi-workers/node
- 81% scaling efficiency
- Batch size of 64 per worker: Global BS=64K
- 16400 Images/sec on 256 nodes
- 26700 images/sec on 512 nodes
- Time-To-Train: ~2 Hrs on 256 Nodes

## 2. Monte Carlo → 3D GANs architecture

Joint Work with CERN and SURFsara at ISC18

**Problem:** Complex physics and geometry modeling via Monte Carlo

Heavy computation requirements

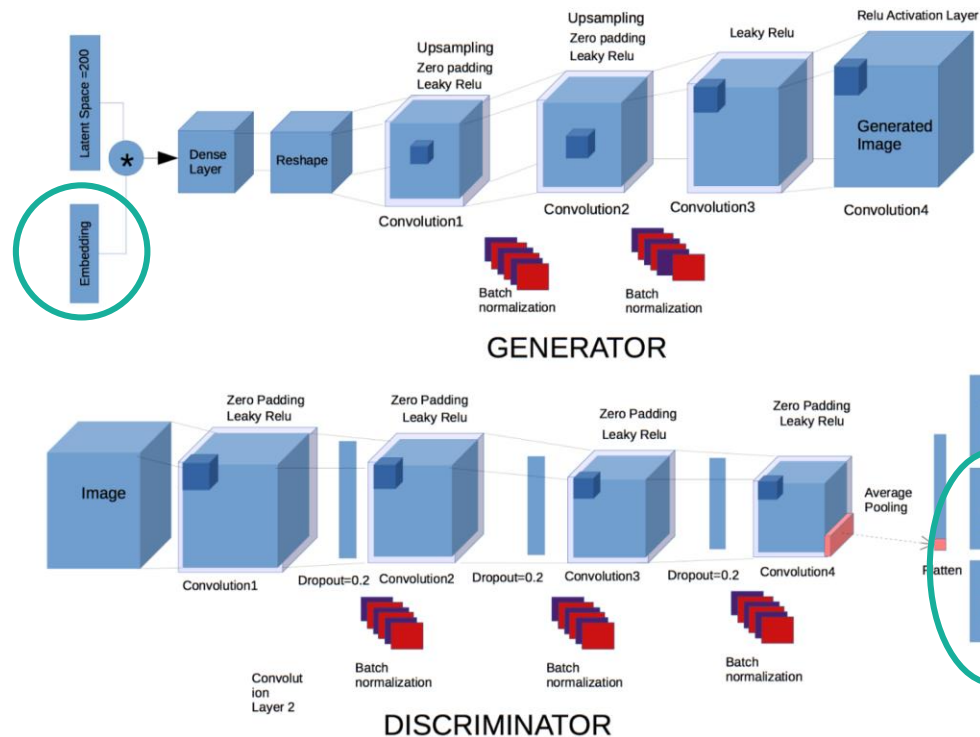

>50% of WLCG power for simulations

Current code cannot cope (HL-LHC in 2025)

**Approach:** 3D conditional GAN

- reproduce full volumes of shower reconstruct in one go
- with two auxiliary regression tasks

Based on 3D convolution/deconvolutions to describe whole volume

# 3D-GANs for High Energy Physics/Large Hadron Collider

3D GANs instead of Monte Carlo Fast Simulations for detector particles with same accuracy

Joint Work with CERN and SURFsara

93% Scaling Efficiency up to 128 Xeon nodes

# Summary

- Intel TensorFlow delivers significant performance gains over baseline
- Setting the correct run-time parameters essential for good performance
- Good support for MPI through plugins and scales ~100's of compute nodes
- Good experiences reported by NERSC/LBNL researchers using Intel TensorFlow on KNL's (CORI system)

# Legal Disclaimers

- Intel processor numbers are not a measure of performance. Processor numbers differentiate features within each processor family, not across different processor families: Go to: Learn About Intel® Processor Numbers [http://www.intel.com/products/processor\\_number](http://www.intel.com/products/processor_number)
- Some results have been estimated based on internal Intel analysis and are provided for informational purposes only. Any difference in system hardware or software design or configuration may affect actual performance.
- Software and workloads used in performance tests may have been optimized for performance only on Intel microprocessors. Performance tests, such as SYSmark and MobileMark, are measured using specific computer systems, components, software, operations and functions. Any change to any of those factors may cause the results to vary. You should consult other information and performance tests to assist you in fully evaluating your contemplated purchases, including the performance of that product when combined with other products.
- Intel does not control or audit the design or implementation of third party benchmarks or Web sites referenced in this document. Intel encourages all of its customers to visit the referenced Web sites or others where similar performance benchmarks are reported and confirm whether the referenced benchmarks are accurate and reflect performance of systems available for purchase.
- Relative performance is calculated by assigning a baseline value of 1.0 to one benchmark result, and then dividing the actual benchmark result for the baseline platform into each of the specific benchmark results of each of the other platforms, and assigning them a relative performance number that correlates with the performance improvements reported.
- SPEC, SPECint, SPECfp, SPECrate, SPECpower, SPECjbb, SPECCompG, SPEC MPI, and SPECjEnterprise\* are trademarks of the Standard Performance Evaluation Corporation. See <http://www.spec.org> for more information.
- TPC Benchmark, TPC-C, TPC-H, and TPC-E are trademarks of the Transaction Processing Council. See <http://www.tpc.org> for more information.
- No computer system can provide absolute reliability, availability or serviceability. Requires an Intel® Xeon® processor E7-8800/4800/2800 v2 product families or Intel® Itanium® 9500 series-based system (or follow-on generations of either.) Built-in reliability features available on select Intel® processors may require additional software, hardware, services and/or an internet connection. Results may vary depending upon configuration. Consult your system manufacturer for more details.  
For systems also featuring Resilient System Technologies: No computer system can provide absolute reliability, availability or serviceability. Requires an Intel® Run Sure Technology-enabled system, including an enabled Intel® processor and enabled technology(ies). Built-in reliability features available on select Intel® processors may require additional software, hardware, services and/or an Internet connection. Results may vary depending upon configuration. Consult your system manufacturer for more details.  
For systems also featuring Resilient Memory Technologies: No computer system can provide absolute reliability, availability or serviceability. Requires an Intel® Run Sure Technology-enabled system, including an enabled Intel® processor and enabled technology(ies). Built-in reliability features available on select Intel® processors may require additional software, hardware, services and/or an Internet connection. Results may vary depending upon configuration. Consult your system manufacturer for more details.

# Optimization Notice

Intel's compilers may or may not optimize to the same degree for non-Intel microprocessors for optimizations that are not unique to Intel microprocessors. These optimizations include SSE2, SSE3, and SSSE3 instruction sets and other optimizations. Intel does not guarantee the availability, functionality, or effectiveness of any optimization on microprocessors not manufactured by Intel.

Microprocessor-dependent optimizations in this product are intended for use with Intel microprocessors. Certain optimizations not specific to Intel microarchitecture are reserved for Intel microprocessors. Please refer to the applicable product User and Reference Guides for more information regarding the specific instruction sets covered by this notice.

**Time-To-Train:** measured using “train” command. Data copied to memory on all nodes in the cluster before training. No input image data transferred over the fabric while training; Performance measured for node count: 200, 210, 240.

### Performance measured with:

export OMP\_NUM\_THREADS=64 (the remaining 4 cores are used for driving communication), export I\_MPI\_FABRICS=tmi, export I\_MPI\_TMI\_PROVIDER=psm2

```
OMP_NUM_THREADS=64 KMP_AFFINITY="proclist=[0-63],granularity=thread,explicit" KMP_HW_SUBSET=1t MLSL_NUM_SERVERS=4  
mpirun.hydra -PSM2 -l -n $SLURM_JOB_NUM_NODES -ppn 1 -f hosts2 -genv OMP_NUM_THREADS 64 -env KMP_AFFINITY "proclist=[0-  
63],granularity=thread,explicit" -env KMP_HW_SUBSET 1t -genv I_MPI_FABRICS tmi -genv I_MPI_HYDRA_BRANCH_COUNT  
$SLURM_JOB_NUM_NODES -genv I_MPI_HYDRA_PMI_CONNECT alltoall sh -c 'cat /ilsvc12_train_lmdb_stripped_64/data.mdb > /dev/null ; cat  
/ilsvc12_val_lmdb_stripped_64/data.mdb > /dev/null ; ulimit -u 8192 ; ulimit -a ; numactl -H ; /caffe/build/tools/caffe train --  
solver=/caffe/models/intel_optimized_models/multinode/resnet_50_256_nodes_8k_batch/solver_poly_quick_large.prototxt -engine "MKL2017"
```

Software and workloads used in performance tests may have been optimized for performance only on Intel microprocessors. Performance tests, such as SYSmark and MobileMark, are measured using specific computer systems, components, software, operations and functions. Any change to any of those factors may cause the results to vary. You should consult other information and performance tests to assist you in fully evaluating your contemplated purchases, including the performance of that product when combined with other products. # Stampede2\*/TACC\* Configuration Details: 2S Intel® Xeon®

\***Stampede2/TACC:** <https://portal.tacc.utexas.edu/user-guides/stampede2>

**Compute Nodes:** 2 sockets Intel® Xeon® Platinum 8160 CPU with 24 cores each @ 2.10GHz for a total of 48 cores per node, 2 Threads per core, L1d 32K; L1i cache 32K; L2 cache 1024K; L3 cache 33792K, 96 GB of DDR4, Intel® Omni-Path Host Fabric Interface, dual-rail. Software: Intel® MPI Library 2017 Update 4/Intel® MPI Library 2019 Technical Preview OFI 1.5.0PSM2 w/ Multi-EP, 10 Gbit Ethernet, 200 GB local SSD, Red Hat® Enterprise Linux 6.7.

**TensorFlow 1.6: Built & Installed from source:** [https://www.tensorflow.org/install/install\\_sources](https://www.tensorflow.org/install/install_sources)

**Model:** Topology specs from <https://github.com/tensorflow/tpu/tree/master/models/official/resnet> (ResNet-50); Batch size as stated in the performance chart

**Convergence & Performance Model:** <https://surfdrive.surf.nl/files/index.php/s/xrEFLPvo7IDRARs>

**Dataset:** ImageNet2012-1K: <http://www.image-net.org/challenges/LSVRC/2012/>

**Performance measured on 256 Nodes with:**

```
OMP_NUM_THREADS=24 HOROVOD_FUSION_THRESHOLD=134217728 export I_MPI_FABRICS=tmi, export I_MPI_TMI_PROVIDER=psm2 \  
mpirun -np 512 -ppn 2 python resnet_main.py --train_batch_size 8192 --train_steps 14075 --num_intra_threads 24 --num_inter_threads 2 --  
mkl=True --data_dir=/scratch/04611/valeriuc/tf-1.6/tpu_rec/train --model_dir model_batch_8k_90ep --use_tpu=False --kmp_blocktime 1
```

## Configuration Details:
